Mass Conversions in DLL file

1 Introduction:

The conversion DLL file of unit Mass is written in C/C++ programming language style, and do not require any extra code in using this DLL file. This DLL file includes 2 functions to handle the Mass conversions as follow:

double LP_UnitConversionsMass_GetLeftValue (char* LeftUnit, char* RightUnit, double RightValue) ;
double LP_UnitConversionsMass_GetRightValue(char* LeftUnit, char* RightUnit, double LeftValue) ;

In Visual Basis, you can identify these functions with the code: Declare Function LP_UnitConversionsMass_GetLeftValue Lib "LP_UnitConversionsMass.dll" _ (ByVal LeftUnit As String, ByVal RightUnit As String, ByVal RightValue As Double) As Double

Declare Function LP_UnitConversionsMass_GetRightValue Lib "LP_UnitConversionsMass.dll" _ (ByVal LeftUnit As String, ByVal RightUnit As String, ByVal RightValue As Double) As Double

2 Problems in Mass conversion

The two functions in DLL file are used to handle all Mass conversions in two problems.**Problem 1**The unknown value is on the **left hand side** of equationThis problem in conversion is described in the figure:

The value x is obtained by either one of two methods:

• Method A : The code is :

Dim x As Double

x = LP_UnitConversionsMass_GetLeftValue("Pound", "Gram", 907.18474)

• Method B : The code is :

```
Dim LeftUnit, RightUnit As String
LeftUnit = "Pound"
RightUnit = "Gram"
Dim RightValue As Double
RightValue = 907.18474
Dim x As Double
x = LP_UnitConversionsMass_GetLeftValue(LeftUnit, RightUnit, RightValue)
```

<u>Problem 2</u> The unknown value is on the **right hand side** of equation This problem in conversions is described in the figure:

The value y is obtained by either one of two methods:

```
• Method A : The code is :
```

```
Dim y As Double
y = LP_UnitConversionsMass_GetRightValue("Pound", "Gram", 2.0)
```

• Method B : The code is :

Dim LeftUnit, RightUnit As String LeftUnit = "Pound" RightUnit = "Gram"

```
Dim LeftValue As Double
LeftValue = 2.0
```

Dim y As Double
y = LP_UnitConversionsMass_GetRightValue(LeftUnit, RightUnit, LeftValue)

3 Unit names in Mass conversions

You can choose the unit name (case sensitive) in the following table for parameters, LeftUnit and/or RightUnit

| Milligram | Stone |
|-----------|--------------------|
| Gram | OunceAvoir |
| Kilogram | MetricTon |
| Carat | ShortTon |
| Grain | LongTon |
| OunceTroy | Pennyweight |
| Pound | ShortHundredweight |
| Slug | LongHundredweight |
| | |

When your unit name is not in this table, the returns of functions are -1 and the error message will issue as shown in the following figures:

or

4 Tip

- 1. The parameters in two functions have the same order of unit name (LeftUnit is first and RightUnit is second) and the last parameter is the known value.
- 2. Use function LP_UnitConversionsMass_GetLeftValue(..) if your **unknown** value is on the **left hand** side of the equation.
- 3. Use function LP_UnitConversionsMass_GetRightValue(..) if your **unknown** value is on the **right** hand side of the equation.
